

Security Operations Center - Threat Analysis Report

Threat Level: LOW | **Total Alerts:** 14 **Generated:**
2025-11-01T09:20:32.804Z

Executive Summary

A total of 14 medium-severity alerts were analyzed, all classified as internal outbound traffic from a Linux system (10.0.2.15) to the external IP 202.79.180.254, located in Singapore. All alerts are associated with the ET INFO GNU/Linux APT User-Agent Outbound signature, indicating standard package management activity using APT for Ubuntu Jammy updates. The traffic pattern shows consistent GET requests to repository paths on sg.archive.ubuntu.com, with no anomalies in HTTP status, data length, or protocol behavior. No evidence of malicious intent, data exfiltration, or command-and-control activity was detected. All alerts are benign and related to routine system updates. Infrastructure alerts were not present. No external threats or suspicious geolocation patterns were identified.

Key Findings

- All 14 alerts are related to standard APT package update operations from a Linux system (10.0.2.15).
- Destination: sg.archive.ubuntu.com (Singapore) – legitimate Ubuntu mirror.
- HTTP method: GET, no data transfer (length = 0), no errors.
- No signs of data exfiltration, C2 communication, or malicious payloads.
- Alerts are informational and non-suspicious; no immediate risk to infrastructure.

Top Priority Threats

IP Address	Type	Country	Direction	Activity	Severity	Confidence	Count
202.79.180.254	External	Singapore	Inbound	APT package update	CRITICAL	High	1

Immediate Actions Required

1. Confirm system 10.0.2.15 is a legitimate, managed Linux host.
2. Verify APT update schedule and ensure no unauthorized package sources are configured.
3. Monitor for future outbound connections to sg.archive.ubuntu.com during update windows.
4. No firewall changes required; traffic is expected and compliant.
5. Document this as routine system behavior in SOC knowledge base.
