

SOC Threat Analysis Report - Manual Analysis

Generated: 2025-10-23 22:18:16
Alerts Analyzed: 10
Server: 100.78.175.127
RAG Mode: Full Context

Executive Summary:

A manual security analysis of 10 recent alerts from the Wazuh SIEM system revealed no evidence of active threats, malicious activity, or security policy violations. All alerts are related to routine system operations, configuration changes, and compliance status updates on the Wazuh server itself. No external IPs, suspicious network connections, or behavioral anomalies were detected. The alerts are low-severity, with no indication of inbound, outbound, or lateral movement threats. All events are consistent with normal system behavior, including service startup, audit logging, and CIS benchmark status transitions. No infrastructure alerts were identified, and no threat classification attributes were triggered. The environment remains secure with no immediate risks requiring action.

Key Findings:

- All 10 alerts are internal system events related to the Wazuh server.
- No external IPs or network connections were involved in any alert.
- No evidence of port changes, policy breaches, or malicious behavior.
- Alerts include service startup, SELinux audit, and CIS benchmark status updates.
- No threat direction (inbound/outbound/lateral) was confirmed.

PRIORITY NETWORK ARTIFACTS (External threats only):

| IP Address | Type | Country | Threat Level | Action Required |

```
|-----|-----|-----|-----|
| - | - | - | - |
```

ALERT SUMMARY TABLE - RESTRICTED FORMAT:

```
| Severity | Count | Top Alert Types | Geographic Origin |
|-----|-----|-----|-----|
| Medium | 3 | CIS Benchmark status change, netstat port change | - |
| Low | 7 | Wazuh server startup, SELinux audit, CIS benchmark status | - |
```

Total Alerts Processed: 10 (Infrastructure alerts excluded: 0)

MITRE ATT&CK Mapping:

- T1518.001: System Administration Tools – Command-line Interface (used in CIS benchmark checks)
- T1082: System Information Discovery (via netstat port monitoring)
- T1047: Windows Management Instrumentation (WMI) – not applicable, but audit events resemble detection of system-level access

Immediate Actions:

- No immediate actions required.
- Monitor Wazuh server logs for recurring status changes.
- Verify CIS benchmark compliance status is intentional.
- Ensure auditd and netstat monitoring is aligned with operational needs.
- No IoCs or C2 indicators identified.

Technical Summary:

The alert set consists entirely of internal system events on the Wazuh server. The events include service startup (rule 502), auditd SELinux checks (80730), and CIS benchmark status transitions (19010, 19012). The netstat port change alert (533) reflects a benign configuration update with no associated threat. All alerts are low-confidence, non-malicious, and consistent with system monitoring and compliance reporting. No external connections, network anomalies, or behavioral deviations were observed. The absence of infrastructure alerts and threat classifications confirms no compromise or active threat.
