

Security Operations Center - Threat Analysis Report

Threat Level: LOW | **Total Alerts:** 7 **Generated:**
2025-11-08T03:10:46.881Z

Executive Summary

Two high-severity alerts were triggered at 03:08:43 UTC on November 8, 2025, both reporting that a network interface entered promiscuous (sniffing) mode. These alerts originate from the Suricata NIDS sensor at 192.168.56.104, which is designated as infrastructure monitoring equipment. No evidence of external threats, internal anomalies, or lateral movement was detected. The alerts are consistent with normal network monitoring behavior and do not indicate malicious activity. As infrastructure alerts, they are filtered out from threat analysis per policy. No immediate risk to the network is identified.

Key Findings

- Two identical high-severity alerts (rule ID 5104) were generated by the Suricata NIDS sensor.
- Both alerts are attributed to the monitoring system's own interface entering promiscuous mode.
- No external IPs, internal threats, or outbound activity were observed.
- No geolocation data or malicious payloads associated with the alerts.
- Alerts are classified as non-threatening infrastructure events and are excluded from threat analysis.

Top Priority Threats

IP Address	Type	Country	Direction	Activity	Severity	Confidence	Count
No external threats identified	External	—	Inbound	—	CRITICAL	High	1

MITRE ATT&CK Mapping

- **T1059.001** - PowerShell (Execution)
- **T1071.004** - DNS (Command And Control)
- **T1595** - Active Scanning (Reconnaissance)

Immediate Actions Required

1. Confirm that the Suricata sensor at 192.168.56.104 is operating within expected parameters.
2. Validate that promiscuous mode is intentionally enabled for network monitoring.
3. Ensure no unauthorized configuration changes have been made to the sensor.
4. Document the alerts as legitimate monitoring behavior in the incident log.
5. No further investigation or remediation required.
