

Security Operations Center - Threat Analysis Report

Threat Level: MEDIUM | **Total Alerts:** 1 **Generated:**
2025-11-13T21:08:27.029Z

Executive Summary

A single high-severity alert was detected indicating a potential fragmented packet scan using Nmap's `-f` flag, targeting an external IP in Singapore from a source in Canada. The activity, classified as an attempted information leak, suggests reconnaissance behavior consistent with network scanning. No evidence of lateral movement, internal threats, or infrastructure compromise was identified. The source IP (173.243.138.91) is external and geolocated to Ottawa, Canada. While the destination is external and not part of internal infrastructure, no indication of active exploitation or data exfiltration was observed. The alert is isolated and does not correlate with known malicious patterns or historical incidents. Immediate attention is warranted to assess whether this represents a broader scanning campaign or a one-off reconnaissance attempt.

Key Findings

- One external reconnaissance attempt detected via UDP-based fragmented packet scan (Nmap `-f`).
- Source IP: 173.243.138.91 (Canada) – external, non-infrastructure.
- Destination IP: 129.126.144.226 (Singapore) – external, not internal or infrastructure.
- Alert severity: High (rule_level 8), categorized as
- No evidence of malicious payload delivery, C2 communication, or lateral movement.

Top Priority Threats

IP Address	Type	Country	Direction	Activity	Severity	Confidence	Count
173.243.138.91	External	Canada	Inbound	Fragmented Scan (Nmap -f)	CRITICAL	High	1

MITRE ATT&CK Mapping

- **T1046** - Network Service Discovery (Discovery)
- **T1047** - Windows Management Instrumentation (Execution)
- **T1071.004** - DNS (Command And Control)

Immediate Actions Required

1. Block inbound UDP traffic from 173.243.138.91 at the perimeter firewall.
2. Monitor for recurring traffic from this IP to any internal or external assets.
3. Review firewall logs for other Nmap-related signatures (e.g., -f, -sS, -sU) over the past 72 hours.
4. Validate that the destination IP (129.126.144.226) is not a known malicious or high-risk host via threat intelligence feeds.
5. Update Suricata rules to increase sensitivity to fragmented packet scans with Nmap indicators.
