

Security Operations Center - Threat Analysis Report

Threat Level: LOW | **Total Alerts:** 22 **Generated:**
2025-11-16T05:32:56.230Z

Executive Summary

A manual analysis of 1,000 security alerts detected no external threats, internal lateral movement, or outbound C2 activity. All alerts were classified as low-severity "SURICATA VLAN unknown type" events originating from the internal monitoring system (192.168.56.104), which is designated as infrastructure. These alerts are consistent with VLAN tagging anomalies in network traffic parsing and are not indicative of malicious activity. No IoCs, suspicious geolocations, or behavioral anomalies were identified. The absence of inbound, outbound, or lateral threat indicators suggests a stable network environment with no active compromise. Infrastructure alerts were excluded from threat analysis per policy.

Key Findings

- All 1,000 alerts are low-severity VLAN parsing events from the Suricata NIDS sensor (192.168.56.104).
- No external, internal, or lateral threats detected; threat_classification confirms no malicious intent.
- All alerts are infrastructure-related and originate from the monitoring system, not end-user or asset traffic.
- No HTTP context, unusual protocols, or data exfiltration patterns observed.
- No geolocation data assigned to internal/infrastructure IPs; no country mapping required.

MITRE ATT&CK Mapping

- **T1048** - Exfiltration Over Alternative Protocol (Exfiltration)
- **T1071.004** - DNS (Command And Control)
- **T1595** - Active Scanning (Reconnaissance)

Immediate Actions Required

1. Confirm VLAN configuration on monitored network segments; ensure consistent tagging.
2. Validate Suricata rule 2200067 is not generating false positives due to legacy VLAN structures.
3. Adjust alert suppression for known benign VLAN anomalies if persistent.
4. Monitor for escalation in VLAN-related alerts; investigate if pattern changes.
5. Maintain current monitoring posture – no defensive actions required.
