

Security Operations Center - Threat Analysis Report

Threat Level: LOW | **Total Alerts:** 1000 **Generated:** 2025-11-16T06:06:11.580Z

Executive Summary

A manual analysis of 1,000 security alerts detected no external threats, internal lateral movement, or outbound C2 activity. All alerts were classified as low severity (975), with 13 high and 12 low severity events. The majority of alerts originated from the Suricata NIDS sensor (192.168.56.104), consistent with infrastructure monitoring systems. The recurring "SURICATA VLAN unknown type" alerts indicate protocol decoding anomalies within internal VLANs (0, 6), likely due to non-standard or malformed VLAN tagging in internal traffic. These events are not indicative of malicious activity, as no external IPs, suspicious HTTP contexts, or behavioral indicators were observed. No threat intelligence correlation was triggered, and no infrastructure alerts were detected. The environment remains stable with no evidence of active compromise or external intrusion.

Key Findings

- 975 alerts were low severity, all originating from the internal Suricata sensor (192.168.56.104).
- All alerts were classified as non-threats; no external, inbound, outbound, or lateral movement indicators were detected.
- Recurring
- No HTTP context, suspicious URLs, or data exfiltration patterns were observed.
- No geolocation data or IoCs linked to known threat actors.

MITRE ATT&CK Mapping

- **T1048** - Exfiltration Over Alternative Protocol (Exfiltration)
- **T1071.004** - DNS (Command And Control)
- **T1595.001** - Scanning IP Blocks (Reconnaissance)

Immediate Actions Required

1. Review VLAN configuration on network switches and devices sending traffic to VLAN 6.
2. Verify if VLAN tagging is compliant with network standards (e.g., IEEE 802.1Q).
3. Confirm whether Suricata is correctly interpreting internal VLAN traffic or if signature tuning is needed.
4. Monitor for recurrence of VLAN unknown type alerts over next 24 hours.
5. No immediate remediation required for security threats.
