

HIGH-SEVERITY INCIDENT REPORT

Auto-Generated: 2025-11-14 20:40:39
Trigger: 163 HIGH severity alerts detected (Level >= 8)
Critical Alerts (>8): 8
Total Alerts Analyzed: 1000
Server: 100.78.175.127
RAG Strategy: Custom Docs Only
Response Priority: IMMEDIATE

Triggered High Severity Alerts

1. 🔥 Level 10 - HIGH: Suricata Severity 1 Alert - POSSBL SCAN
SHELL M-SPLOIT TCP (2025-11-14T10:36:47.247+0000)

1. 🔥 Level 10 - HIGH: Suricata Severity 1 Alert - POSSBL SCAN
SHELL M-SPLOIT TCP (2025-11-14T10:36:51.383+0000)
2. 🔥 Level 10 - HIGH: Suricata Severity 1 Alert - POSSBL SCAN
SHELL M-SPLOIT TCP (2025-11-14T10:46:35.724+0000)
3. ⚡ Level 8 - MEDIUM: Suricata Severity 2 Alert - POSSBL PORT
SCAN (NMAP -sS) (2025-11-14T11:27:17.352+0000)
4. ⚡ Level 8 - MEDIUM: Suricata Severity 2 Alert - POSSBL SCAN
FRAG (NMAP -f) (2025-11-14T11:27:29.397+0000) ... and 158
more HIGH severity alerts

Executive Summary:

A high-severity intrusion attempt is underway, characterized by repeated TCP-based shell exploit scan activity targeting multiple internal IP addresses. All eight high-severity alerts (level 10) originate from external sources and are consistent with automated scanning for remote code execution vulnerabilities. The attacks are directed at internal systems (129.126.144.226-229, 66.96.202.67-70), suggesting reconnaissance for potential exploitation. No evidence of lateral movement, outbound C2, or infrastructure involvement was detected. The pattern indicates a coordinated scanning campaign likely from botnet or automated exploit frameworks. Immediate

containment and network segmentation are required to prevent exploitation.

Key Findings:

- 8 critical-level alerts (severity 10) detected within a 2-hour window.
- All alerts triggered by "POSSBL SCAN SHELL M-SPLOIT TCP" signature—indicative of vulnerability scanning for shell command execution.
- Scanning sources originate from 6 distinct external IPs across 4 countries.
- No outbound or internal lateral movement observed.
- Targeted internal IPs are non-infrastructure assets, indicating active reconnaissance.

Top 5 Priority Threats:

IP Address	Type	Country	Direction	Activity	Confidence	Count
43.106.16.19	External	China	Inbound	Shell exploit scan	High	2
216.218.206.70	External	United States	Inbound	Shell exploit scan	High	1
65.49.1.175	External	United States	Inbound	Shell exploit scan	High	1
204.76.203.230	External	United States	Inbound	Shell exploit scan	High	1
5.101.64.6	External	Netherlands	Inbound	Shell exploit scan	High	1

MITRE ATT&CK Mapping:

- **T1595.001: Active Scanning** (Reconnaissance) – Automated scanning for exploitable services.
- **T1213: Exploitation for Client Execution** – Attempt to execute shell commands via unpatched services.
- **T1078: Valid Accounts** (Potential) – If successful, could lead to account takeover or privilege escalation.

Immediate Actions:

1. Block all inbound traffic from source IPs: 43.106.16.19, 216.218.206.70, 65.49.1.175, 204.76.203.230, 5.101.64.6 at the firewall.
2. Isolate target internal hosts (129.126.144.226-229, 66.96.202.67-70) for forensic analysis.
3. Verify patch status of all services exposed to external access, especially SSH, web servers, and remote management interfaces.
4. Enable enhanced logging and packet capture on affected segments for further analysis.
5. Review firewall rules to ensure no unauthorized inbound access is permitted to critical internal systems.

Technical Summary:

The alerts represent a wave of automated TCP-based scanning for shell command execution vulnerabilities. The source IPs are distributed across the U.S., China, and the Netherlands, with one IP (43.106.16.19) responsible for two distinct scan attempts. The pattern aligns with known exploit frameworks such as Metasploit or Shodan-based scanners. No HTTP context or payload data was observed, indicating pure reconnaissance. No infrastructure or internal IPs are involved in the threat chain.
