Response Priority: IMMEDIATE

Triggered High Severity Alerts

1. 🔥 Level 10 - HIGH: Suricata Severity 1 Alert - POSSBL SCAN SHELL M-SPLOIT TCP (2025-11-15T07:38:41.371+0000)

Executive Summary:

A high-severity intrusion attempt is underway, characterized by repeated scanning activity targeting potential shell exploit vulnerabilities across multiple external IPs. The alerts indicate coordinated reconnaissance targeting exposed systems, with 10 critical-level events detected within a 3-hour window. All alerts are inbound from external sources, consistent with automated scanning campaigns. No internal threats, lateral movement, or outbound C2 activity observed. The primary signature, "POSSBL SCAN SHELL M-SPLOIT TCP/UDP," suggests attempts to identify systems vulnerable to shell-based exploits. Geolocation analysis reveals origins in multiple regions, including North America and Asia, with no infrastructure or internal IPs involved. Immediate containment and threat blocking are recommended to prevent exploitation.

Key Findings:

- 10 high-severity alerts (level 10) detected, all originating from external IPs.
- All alerts are inbound scans targeting potential shell exploit vulnerabilities.
- Multiple source IPs from North America (US) and Asia (India, China) observed.
- Target IPs are external-facing, with no internal systems involved.

- No evidence of data exfiltration, C2 communication, or lateral movement.

Top 5 Priority Threats:

IP Address	Type	Country	Direction	Activity	Confidence	Count
103.227.91.90	External	India	Inbound	Shell exploit scan	High	2
64.62.197.190	External	United States	Inbound	Shell exploit scan	High	1
64.62.197.19	External	United States	Inbound	Shell exploit scan	High	1
65.49.1.183	External	United States	Inbound	Shell exploit scan	High	1
93.174.95.106	External	Germany	Inbound	Shell exploit scan	High	1

Additional X alerts filtered for brevity. Infrastructure alerts excluded: 0

MITRE ATT&CK Mapping:

- T1595.001: Active Scanning - Network Scanning

Automated discovery of systems with potential shell exploit vulnerabilities.

- T1046: Network Service Scanning

Scanning of TCP/UDP ports for services susceptible to shell-based exploitation.

- T1590: Exploit Public-Facing Application

Targeting exposed systems with known or potential shell exploit vectors.

Immediate Actions:

1. Block all traffic from source IPs: 103.227.91.90, 64.62.197.190, 64.62.197.19, 65.49.1.183, 93.174.95.106 at firewall level.
2. Implement rate limiting on inbound TCP/UDP traffic to public-facing systems.
3. Conduct vulnerability scan on target IPs (118.189.20.178, 66.96.202.66, 129.126.144.228, 129.126.144.229, 66.96.202.70) for shell exploit vulnerabilities.
4. Review and update Suricata rules to enhance detection of shell exploit patterns.

5. Monitor for follow-up exploitation attempts or new scan patterns from similar IP ranges.

Technical Summary:

The incident is a coordinated scanning campaign targeting systems with potential shell-based exploit vulnerabilities. All alerts are inbound, external-to-external, and exhibit consistent signatures across TCP and UDP protocols. The absence of internal threats or outbound activity indicates this is reconnaissance-only. The attack pattern aligns with known exploit scanning behavior, particularly targeting misconfigured or unpatched services. No IoCs from custom intelligence were available, but the signature pattern is well-documented in public threat feeds. No infrastructure IPs involved.
