Response Priority: IMMEDIATE

Triggered High Severity Alerts

1. 🔥 Level 10 - HIGH: Suricata Severity 1 Alert - POSSBL SCAN
SHELL M-SPLOIT TCP (2025-11-15T11:44:47.546+0000)

Executive Summary:

A high-severity intrusion attempt is underway, characterized by repeated TCP-based scanning activity targeting multiple internal hosts with signatures indicating potential shell exploit attempts. The attacks originate from 11 distinct external IP addresses, primarily leveraging cloud-based infrastructure. The most active source, 3.17.73.23, conducted simultaneous scans across four internal endpoints, suggesting coordinated reconnaissance. All alerts are classified as critical due to the nature of the signature and the volume of activity. No infrastructure or internal IPs are involved in threat propagation. Geolocation reveals origins in the United States and Asia, with no known malicious activity attributed to these regions in recent threat intelligence. Immediate network isolation and firewall blocking are recommended to prevent exploitation.

Key Findings:

- 33 high-severity alerts detected, all related to potential shell exploit scanning via TCP.
- Most aggressive source: 3.17.73.23 (4 attacks on internal hosts within 0.1 seconds).
- All external sources are cloud-hosted IPs (AWS, Azure), consistent with automated scanning tools.
- No outbound, lateral, or internal threats detected; attack remains in

reconnaissance phase.

- No infrastructure alerts present; all alerts are from external threat sources.

Top 5 Priority Threats:

IP Address	Type	Country	Direction	Activity	Confidence	Count
3.17.73.23	External	United States	Inbound	Multiple shell exploit scans	High	4
4.227.180.232	External	United States	Inbound	Shell exploit scan	High	1
20.55.73.223	External	United States	Inbound	Shell exploit scan	High	1
20.163.34.41	External	United States	Inbound	Shell exploit scan	High	1
20.14.72.151	External	United States	Inbound	Shell exploit scan	High	1

Additional X alerts filtered for brevity. Infrastructure alerts excluded: 0

MITRE ATT&CK Mapping:

- **T1046 - Network Service Scanning:** Automated scanning for open services and vulnerabilities.
- **T1078 - Valid Accounts:** Attempt to exploit shell access via unauthenticated or weakly secured endpoints.
- **T1047 - OS Command Injection:** Signature indicates potential exploitation of command execution vulnerabilities.

Immediate Actions:

1. Block all traffic from source IPs 3.17.73.23, 4.227.180.232, 20.55.73.223, 20.163.34.41, and 20.14.72.151 at the perimeter firewall.
2. Implement rate-limiting on inbound TCP connections to internal hosts on port 22 (SSH) and 80/443.
3. Conduct a full host integrity check on affected internal systems: 129.126.144.226-229, 66.96.202.66-69.
4. Enable enhanced logging and real-time alerting for any shell command execution attempts.
5. Review and harden SSH configurations on all exposed endpoints.

Technical Summary:

The attack pattern exhibits characteristics of automated vulnerability

scanners targeting known shell exploit vectors. The use of multiple cloud-based IPs suggests botnet or rented infrastructure. The high speed of attack from 3.17.73.23 (4 simultaneous scans in under 1 second) indicates a scripted, high-volume probing campaign. No HTTP context or data exfiltration observed. All traffic is TCP-based and directed at non-standard ports, consistent with reconnaissance. No IoCs beyond source IPs are currently available. No indication of successful compromise.
