Response Priority: IMMEDIATE

Triggered High Severity Alerts

1. 🔥 Level 10 - HIGH: Suricata Severity 1 Alert - POSSBL SCAN SHELL M-SPLOIT TCP (2025-11-15T12:37:29.717+0000)

Executive Summary:

A high-severity intrusion attempt is underway, characterized by rapid, multi-target scanning activity targeting internal infrastructure. The primary threat originates from 3.17.73.23, which initiated 4 simultaneous probes against four internal IP addresses (129.126.144.226-229) within seconds, indicating a coordinated scanning campaign. Additional sources (103.227.91.89, 147.185.132.115, 20.150.195.172, 20.29.49.134, 115.231.78.10, 40.124.175.226) are also engaged in similar scanning behavior. All alerts are classified as "POSSBL SCAN SHELL M-SPLOIT TCP," signaling potential exploitation of shell-based vulnerabilities. No evidence of lateral movement or data exfiltration detected. Threats are external, with geolocation data indicating activity from Asia-Pacific and North America. Immediate network segmentation and blocking of source IPs are required.

Key Findings:

- 326 external threats detected, with 33 classified as high-severity ($\geq$ level 8).
- All high-severity alerts are variations of "POSSBL SCAN SHELL M-SPLOIT TCP," indicating reconnaissance for shell exploit vectors.
- Primary source: 3.17.73.23 (Malaysia), conducting rapid-fire scans across four internal targets.

- Multiple external IPs from diverse regions (India, China, US, Japan) participating in scanning activity.
- No internal threat, outbound, or lateral movement indicators detected; attack remains in reconnaissance phase.

Top 5 Priority Threats:

IP Address	Type	Country	Direction	Activity	Confidence	Count
3.17.73.23	External	Malaysia	Inbound	Shell exploit scan	High	4
103.227.91.89	External	India	Inbound	Shell exploit scan	High	1
147.185.132.115	External	China	Inbound	Shell exploit scan	High	1
20.150.195.172	External	United States	Inbound	Shell exploit scan	High	1
20.29.49.134	External	United States	Inbound	Shell exploit scan	High	1

Additional X alerts filtered for brevity. Infrastructure alerts excluded: 0.

MITRE ATT&CK Mapping:

- **T1046 - Network Service Scanning:** Multiple IPs scanning internal hosts for exploitable services.
- **T1071.004 - Application Layer Protocol: Web Protocols:** Use of TCP-based shell exploit patterns indicative of web service probing.
- **T1595 - Active Scanning:** Aggressive scanning across multiple internal IPs from external sources.

Immediate Actions:

1. Block all source IPs (3.17.73.23, 103.227.91.89, 147.185.132.115, 20.150.195.172, 20.29.49.134, 115.231.78.10, 40.124.175.226) at network firewall and IDS/IPS.
2. Isolate affected internal hosts (129.126.144.226–229) for forensic analysis.
3. Enforce strict egress filtering to prevent any outbound communication from internal assets.
4. Audit all systems with open TCP services for shell access vulnerabilities (e.g., SSH, telnet, web shells).
5. Update Suricata rules to detect and alert on future shell exploit scan patterns.

Technical Summary:

The attack pattern is consistent with automated scanning for shell-based exploits, likely targeting legacy or misconfigured services. The timing and distribution suggest a botnet or automated attack framework. No HTTP context or data transfer observed. All alerts are inbound from external sources. No infrastructure or internal IPs involved in threat propagation. Prioritize blocking and system hardening.
