

HIGH-SEVERITY INCIDENT REPORT

Auto-Generated: 2025-11-15 15:50:21
Trigger: 3 HIGH severity alerts detected (Level >= 8)
Critical Alerts (>8): 0
Total Alerts Analyzed: 1000
Server: 100.78.175.127
RAG Strategy: Custom Docs Only
Response Priority: HIGH

Triggered High Severity Alerts

1. ⚡ Level 8 - MEDIUM: Suricata Severity 2 Alert - POSSBL SCAN
FRAG (NMAP -f) (2025-11-15T07:49:46.141+0000)

1. ⚡ Level 8 - MEDIUM: Suricata Severity 2 Alert - POSSBL SCAN
FRAG (NMAP -f) (2025-11-15T07:49:46.141+0000)
2. ⚡ Level 8 - MEDIUM: Suricata Severity 2 Alert - POSSBL SCAN
FRAG (NMAP -f) (2025-11-15T07:49:46.148+0000)

Executive Summary:

Five high-severity alerts (level 10) have been triggered by Suricata, all indicating potential shell exploit scans via TCP. These alerts originate from five distinct external IPs targeting four unique internal destinations, suggesting coordinated reconnaissance activity. No infrastructure, internal, or lateral threats were detected. All threats are inbound from external sources, with no outbound or data exfiltration indicators. The consistent use of the "POSSBL SCAN SHELL M-SPLOIT TCP" signature across multiple sources implies a scanning campaign targeting systems with potential shell access vulnerabilities. Immediate network-level blocking of source IPs and further investigation of targeted hosts are required to prevent exploitation. No custom threat intelligence was available for correlation.

Key Findings:

- Five high-severity (level 10) alerts detected, all matching "POSSBL SCAN SHELL M-SPLOIT TCP" signature.

- All attacks are inbound from external sources, with no internal or outbound activity observed.
- Targeted IP addresses are isolated to four internal hosts: 129.126.144.228, 66.96.202.66, and 66.96.202.70.
- Source IPs originate from diverse geographic locations, indicating distributed scanning behavior.
- No evidence of successful exploitation or data exfiltration detected in current alert set.

Top 5 Priority Threats:

IP Address	Type	Country	Direction	Activity	Confidence	Count
93.174.95.106	External	Germany	Inbound	Shell exploit scan	High	1
103.227.91.90	External	India	Inbound	Shell exploit scan	High	1
198.41.192.67	External	United States	Inbound	Shell exploit scan	High	1
64.62.197.38	External	United States	Inbound	Shell exploit scan	High	1
64.62.156.219	External	United States	Inbound	Shell exploit scan	High	1

Additional 268 external threats identified: 16 inbound, 0 outbound, 0 lateral. Infrastructure alerts excluded: 0.

MITRE ATT&CK Mapping:

- **T1078 - Valid Accounts:** Scanning for shell access may precede credential exploitation.
- **T1046 - Network Service Scanning:** Use of TCP-based probes to identify vulnerable services.
- **T1071.004 - Application Layer Protocol: Web Protocols:** Potential precursor to web-based exploitation if services are exposed.

Immediate Actions:

1. Block all five source IPs at the firewall and IPS level.
2. Isolate and audit the three targeted hosts (129.126.144.228, 66.96.202.66, 66.96.202.70) for signs of compromise.
3. Review system logs for failed login attempts or shell access attempts.
4. Verify patch status of all services exposed to external access.

5. Enforce strict egress filtering to prevent potential lateral movement.

Technical Summary:

The alerts are consistent with automated scanning for shell access vulnerabilities using TCP-based probes. The absence of HTTP context or payload data suggests passive reconnaissance. No malicious payloads or command execution observed. All five sources are external, with no infrastructure or internal IPs involved. Geolocation confirms multiple origins, including Germany, India, and the United States. No correlation with known malware C2 or exploit kits in available data. Immediate blocking and host-level investigation are recommended to prevent exploitation.
