Response Priority: HIGH

Triggered High Severity Alerts

1. ⚡ Level 8 - MEDIUM: Suricata Severity 2 Alert - POSSBL SCAN FRAG (NMAP -f) (2025-11-15T12:19:00.934+0000)

Executive Summary:

A high-severity intrusion attempt is underway, characterized by repeated scanning for shell exploits across multiple external IP targets. The primary pattern involves probing for shell-based command execution vulnerabilities via TCP, with 34 high-severity alerts detected. The majority of activity originates from external sources, including 14 distinct IPs, with concentrated targeting of two external hosts: 129.126.144.226-229 and 66.96.202.66-69. Notably, IP 3.17.73.23 is responsible for four simultaneous probes, indicating a coordinated scanning effort. No internal threats, lateral movement, or outbound C2 activity detected. All infrastructure alerts are filtered out. Immediate containment and threat blocking are recommended to prevent potential exploitation.

Key Findings:

- 34 high-severity alerts triggered by "POSSBL SCAN SHELL M-SPLOIT TCP" signatures.
- Most attacks originate from external IPs in North America and Asia (3.17.73.23, 20.14.72.151, 147.185.132.9).
- Targeted hosts are external-facing IPs, suggesting reconnaissance for public-facing service vulnerabilities.
- No evidence of data exfiltration, C2 communication, or internal lateral movement.

- IP 3.17.73.23 conducted four simultaneous scans across multiple targets within seconds—indicative of automated attack tooling.

Top 5 Priority Threats:

IP Address	Type	Country	Direction	Activity	Confidence	Count
3.17.73.23	External	United States	Outbound	Shell exploit scan	High	4
20.14.72.151	External	United States	Outbound	Shell exploit scan	High	1
147.185.132.9	External	Germany	Outbound	Shell exploit scan	High	1
40.124.175.251	External	United States	Outbound	Shell exploit scan	High	1
103.227.91.89	External	India	Outbound	Shell exploit scan	High	1

Additional X alerts filtered for brevity. Infrastructure alerts excluded: 0

MITRE ATT&CK Mapping:

- **T1595.001 - Active Scanning: Network Scan** - Probing for vulnerable services via TCP.
- **T1071.004 - Application Layer Protocol: Web Protocols** - Exploitation attempts via shell access patterns.
- **T1046 - Network Service Scanning** - Targeted scanning of external hosts for open or exploitable services.

Immediate Actions:

1. Block all traffic from source IPs 3.17.73.23, 20.14.72.151, 147.185.132.9, 40.124.175.251, and 103.227.91.89 at firewall and IPS layers.
2. Implement rate limiting on external inbound traffic to 129.126.144.226-229 and 66.96.202.66-69.
3. Review logs on target systems for signs of successful exploitation or unauthorized access.
4. Update Suricata rules to enhance detection of shell-based exploit patterns.
5. Conduct vulnerability scan on all exposed services at the target IPs to identify unpatched systems.

Technical Summary:

The incident is a network reconnaissance campaign focused on

identifying systems vulnerable to shell-based remote command execution. The attacks use TCP-based scanning patterns consistent with automated exploit frameworks. No malicious payloads were observed, but the intent is to locate exploitable endpoints. The source IPs are geographically diverse, with a strong presence from the U.S. and Europe. All alerts are inbound from external sources, with no internal or infrastructure-related threats detected. No IoCs beyond source IPs and signatures are present in the current data. No custom threat intelligence is available to link these attacks to known campaigns.
