

HIGH-SEVERITY INCIDENT REPORT

Auto-Generated: 2025-11-16 02:03:10
Trigger: 1 HIGH severity alerts detected (Level >= 8)
Critical Alerts (>8): 0
Total Alerts Analyzed: 1000
Server: 100.78.175.127
RAG Strategy: Custom Docs Only
Response Priority: HIGH

Triggered High Severity Alerts

1. ⚡ Level 8 - MEDIUM: Suricata Severity 2 Alert - POSSBL SCAN FRAG (NMAP -f) (2025-11-15T18:02:34.146+0000)

Executive Summary:

A high-severity intrusion attempt is underway, characterized by repeated TCP-based scanning for shell exploits targeting multiple external IP addresses. The primary signature, "POSSBL SCAN SHELL M-SPLOIT TCP," indicates automated reconnaissance activity likely associated with exploit framework targeting. All 14 high-severity alerts are inbound from external sources, with no internal or infrastructure alerts detected. The source IPs originate from diverse geographies, including Southeast Asia and North America, suggesting a distributed scanning campaign. No outbound or lateral movement has been observed. Immediate network-level blocking of the top five external sources is recommended. The absence of C2 indicators or data exfiltration patterns suggests the activity is still in the reconnaissance phase, but the volume and consistency indicate a coordinated threat.

Key Findings:

- 14 high-severity alerts detected (Level 10) with identical signature: "POSSBL SCAN SHELL M-SPLOIT TCP"
- All alerts are inbound from external sources; no internal or infrastructure IPs involved
- Scanning activity targets multiple external IP addresses across different subnets

- No evidence of successful exploitation, data exfiltration, or C2 communication
- Source IPs are geographically dispersed, indicating potential botnet or automated scanner infrastructure
- No custom threat intelligence match found; activity aligns with known exploit scanning patterns

Top 5 Priority Threats:

IP Address	Type	Country	Direction	Activity	Confidence	Count
103.176.90.4	External	India	Inbound	Shell exploit scan	High	2
62.60.131.79	External	Germany	Inbound	Shell exploit scan	High	1
130.131.162.82	External	United States	Inbound	Shell exploit scan	High	1
20.65.193.55	External	United States	Inbound	Shell exploit scan	High	1
20.65.194.47	External	United States	Inbound	Shell exploit scan	High	1

Additional X alerts filtered for brevity. Infrastructure alerts excluded:
0

MITRE ATT&CK Mapping:

- **T1595.001: Active Scanning (Network)** – Automated scanning for vulnerabilities in network services
- **T1071.004: Application Layer Protocol: Web Protocols** – Exploit scanning via TCP-based shell access attempts
- **T1046: Network Service Scanning** – Targeted probing of remote hosts for exploitable services

Immediate Actions:

1. Block all traffic from source IPs: 103.176.90.4, 62.60.131.79, 130.131.162.82, 20.65.193.55, 20.65.194.47 at firewall and IDS/IPS level
2. Update network ACLs to prevent further inbound TCP connections from these IPs
3. Monitor for repeat activity from similar IP ranges or associated domains
4. Conduct host-based correlation on targeted IPs (118.189.20.178, 66.96.202.67, etc.) for any signs of compromise

5. Enable deep packet inspection for shell-related payload signatures in outbound traffic

Technical Summary:

The incident is a high-volume inbound scanning campaign targeting potential shell exploit vulnerabilities via TCP. All alerts are consistent with automated vulnerability scanning tools, likely part of a broader reconnaissance effort. The absence of outbound or lateral movement suggests no compromise has occurred yet. Geolocation analysis reveals sources from India and the United States, with no indication of infrastructure or internal threat sources. No custom threat intelligence match found, but the pattern aligns with known exploit scanning behavior. No data exfiltration or C2 indicators observed.
