

SOC Threat Analysis Report - Manual Analysis

Generated: 2025-10-15 14:54:42
Alerts Analyzed: 12
Server: 100.78.175.127
RAG Mode: Full Context

Executive Summary:

A manual analysis of 12 low-severity alerts from the Wazuh SIEM system revealed no evidence of active threats, malicious activity, or infrastructure compromise. All alerts are related to standard SSH authentication and session management events (PAM login/session open/close, SSH authentication success) on the wazuh-server agent. No external IPs, suspicious protocols, or anomalous behaviors were detected. The threat classification indicates no inbound, outbound, lateral, or infrastructure-related threats. All events are consistent with normal system operations. No immediate action is required, but continued monitoring of SSH access logs is recommended to detect future anomalies.

Key Findings:

- All 12 alerts are low-severity, non-malicious system events.
- Events are confined to SSH authentication and session lifecycle on the Wazuh server.
- No external IPs, suspicious URLs, or data exfiltration indicators detected.
- No threat classification flags for internal or external threats.
- No correlation with known attack patterns or historical incidents.

Top 5 Priority Threats:

IP Address	Type	Country	Direction	Activity	Confidence	Count

-----	-----	-----	-----	-----	-----	-----

Note: No external threats identified. All alerts are internal system events. Infrastructure alerts excluded: 0.

MITRE ATT&CK Mapping:

- T1078.001: Valid Accounts (Logon Session Management) - Low relevance; normal PAM session handling.
- T1071.004: Application Layer Protocol: SSH - Standard protocol usage, no exploitation detected.
- T1049: System Services Discovery - Not applicable; no service enumeration observed.

Immediate Actions:

- Monitor SSH access logs for repeated authentication attempts.
- Ensure strong authentication mechanisms (e.g., key-based auth, MFA) are enforced.
- Review Wazuh agent configuration for unnecessary alert noise.
- Confirm that no unauthorized users have access to the Wazuh server.
- Schedule periodic audit of system login records.

Technical Summary:

All alerts are standard SSH and PAM events indicating normal user session lifecycle on the Wazuh server. The events are consistent with legitimate system access and do not indicate compromise. No IoCs, suspicious URLs, or external communication were detected. The absence of external threat indicators and infrastructure alerts confirms a low-risk environment. No further investigation or response actions are warranted at this time.
