

Security Operations Center - Threat Analysis Report

Threat Level: MEDIUM | **Total Alerts:** 2 **Generated:**
2025-11-16T13:16:33.745Z

Executive Summary

Two low-severity alerts were generated by the Suricata NIDS sensor (192.168.56.104) related to "SURICATA VLAN unknown type" events. Both alerts originated from the internal monitoring infrastructure and are consistent with VLAN tagging anomalies during protocol decoding. No external threat sources were detected, and no traffic involving the 66.96.0.0/16 network or other owned assets was observed. The alerts are classified as infrastructure noise with no indication of malicious activity, system compromise, or network intrusion. No immediate defensive actions are required. The pattern is consistent with known benign protocol handling issues in Suricata when processing malformed or non-standard VLAN frames.

Key Findings

- Two identical alerts from Suricata NIDS sensor (192.168.56.104) within a 30-second window
- Alerts triggered by
- Source IP is the internal Suricata sensor itself — not a threat
- No external IPs involved; no traffic to or from owned infrastructure
- VLAN tags (0, 6) indicate non-standard or malformed VLAN encapsulation
- No evidence of exploitation, reconnaissance, or lateral movement
- No indicators of compromise detected across the environment

Top Priority Threats

IP Address	Type	Country	Direction	Activity	Severity	Confidence	Count
192.168.56.104	Internal	VLAN protocol decode anomaly	Inbound	2	MEDIUM	High	1

Immediate Actions Required

1. **No blocking required:** Source IP is internal monitoring infrastructure (192.168.56.104)
2. **No service hardening needed:** No exposed services targeted
3. **No enhanced monitoring required:** No suspicious behavior detected
4. **No investigation needed:** No compromise indicators or external contact
5. **No threat hunting required:** No IoCs or patterns suggesting malicious intent
