

Security Operations Center - Threat Analysis Report

Threat Level: LOW | **Total Alerts:** 36 **Generated:**
2025-11-27T07:35:40.725Z

Executive Summary

A series of low-severity network anomalies were detected originating from external sources targeting the organization's public infrastructure. All alerts are associated with TCP checksum validation issues and VLAN tag decoding errors, with no evidence of exploitation or compromise. The primary source of activity is an external IP (3.0.199.177) located in Singapore, engaged in TLS-encrypted traffic to the organization's public-facing IP (129.126.144.226) on port 443. No inbound, outbound, or lateral movement threats were identified. The activity appears to be network-level noise or misconfigured traffic rather than malicious behavior. No indicators of compromise or active attack campaigns detected. Recommended actions focus on traffic monitoring and firewall-level filtering for the source IP.

Key Findings

- Multiple low-severity Suricata alerts (TCPv4 invalid checksum, VLAN unknown type) observed, primarily from infrastructure monitoring (192.168.56.104) and external sources.
- All external threats originate from 3.0.199.177 (Singapore), targeting 129.126.144.226 on port 443 via TLS.
- No evidence of successful exploitation, C2 activity, or data exfiltration.
- Traffic exhibits normal TLS handshake behavior with consistent packet counts and byte flows; no anomalies in application-layer protocol.

- No historical patterns or known malicious IoCs associated with the source IP or traffic behavior.
- All alerts classified as noise or protocol-level anomalies with low confidence in malicious intent.

Top Priority Threats

IP Address	Type	Country	Direction	Activity	Severity	Confidence	Count
3.0.199.177	External	Singapore	Inbound	3	LOW	High	1

Immediate Actions Required

1. **Network-level blocking:** Implement firewall rule to block incoming traffic from 3.0.199.177 on port 443.
2. **Monitoring enhancement:** Deploy additional packet capture and flow analysis on 129.126.144.226 for TLS traffic anomalies.
3. **Investigation:** Review system logs on 129.126.144.226 for any unexpected TLS handshake attempts or certificate validation issues.
4. **Threat hunting:** Search for similar TCP checksum errors across other external IPs in past 7 days.
5. **Configuration review:** Validate network stack and packet processing on Suricata sensor (192.168.56.104) for false positive triggers.
