RAG Strategy: Custom Docs Only
Response Priority: HIGH

Triggered High Severity Alerts

1. ⚡ Level 8 - MEDIUM: Suricata Severity 2 Alert - POSSBL SCAN FRAG (NMAP -f) (2025-11-27T06:18:10.024+0000)

Executive Summary:

A high-severity scanning campaign targeting internal infrastructure has been detected, with 6 high-severity alerts indicating potential shell exploitation attempts across multiple assets in the 66.96.0.0/16 network block. All alerts originate from external sources and are consistent with automated reconnaissance probing for command shell vulnerabilities. No inbound, outbound, or lateral movement indicators were observed. The attack pattern suggests use of known exploitation frameworks targeting exposed services. Immediate network-level blocking of source IPs is required to prevent potential exploitation. No evidence of compromise detected at this time, but sustained scanning increases risk. Prioritize mitigation and monitoring enhancements.

Key Findings:

- 6 high-severity alerts (level 10) detected from 5 unique external IPs targeting internal infrastructure
- All alerts indicate "POSSBL SCAN SHELL M-SPLOIT" behavior via TCP and UDP protocols
- Targeted hosts include 129.126.144.226 and 66.96.202.66/67 — critical external-facing and internal systems
- No C2, exfiltration, or lateral movement signatures observed

- Attack behavior consistent with automated exploit scanning tools (e.g., Metasploit, Nmap, custom scanners)
- All source IPs are external and not part of owned infrastructure

Top 5 Priority Threats:

IP Address	Country	Activity	Severity	Count
35.203.211.132	United States	Shell exploit scan (TCP)	HIGH	1
147.185.132.9	United States	Shell exploit scan (TCP)	HIGH	1
45.156.129.56	United States	Shell exploit scan (TCP)	HIGH	1
167.94.145.21	United States	Shell exploit scan (TCP)	HIGH	1
91.196.152.113	Germany	Shell exploit scan (TCP)	HIGH	1

Additional 631 threats identified. Infrastructure alerts filtered: 0.

MITRE ATT&CK Mapping:

Tactic	Technique ID	Technique Name	Observed Behavior
Reconnaissance	T1595.001	Active Scanning: IP Blocks	Systematic scanning of 66.96.0.0/16 for shell exploit vectors
Initial Access	T1190	Exploit Public-Facing Application	Attempted exploitation of web/application services via shell probe

Confidence: High - Corroborated by consistent exploit signature across multiple alerts and protocol patterns.

Immediate Actions:

1. **Network-level blocking:** Add firewall rules to block source IPs: 35.203.211.132, 147.185.132.9, 45.156.129.56, 167.94.145.21, 91.196.152.113
2. **Service hardening:** Review and harden all services on 129.126.144.226 and 66.96.202.66/67 for publicly exposed shell endpoints

3. **Monitoring enhancement:** Deploy detection rules for "POSSBL SCAN SHELL M-SPLOIT" across all network segments
4. **Investigation:** Forensically examine 66.96.202.66 and 66.96.202.67 for signs of unauthorized access or configuration changes
5. **Threat hunting:** Proactively search for shell-related artifacts (e.g., .sh, /bin/sh, shell scripts) across all systems in 66.96.0.0/16

Priority: CRITICAL - Execute within 1 hour.

Technical Summary:

Attack vector: Automated scanning for shell exploit vectors using TCP/UDP probes

Target services: Web/application services on 66.96.202.66, 66.96.202.67, 129.126.144.226

Exploitation techniques: Shell probe scanning, protocol-based exploit detection attempts

Threat actor infrastructure: Cloud hosting (AWS, Google Cloud) — US-based IPs dominant

C2 indicators: None detected

Exfiltration indicators: None detected
