RAG Strategy: Custom Docs Only
Response Priority: HIGH

Triggered High Severity Alerts

1. 🔥 Level 10 - HIGH: Suricata Severity 1 Alert - POSSBL SCAN SHELL M-SPLOIT TCP (2025-11-27T07:32:53.908+0000)

Executive Summary:

A high-severity scanning campaign targeting internal infrastructure has been detected, with three distinct external IPs conducting suspected shell exploitation scans against assets within the 66.96.0.0/16 network block. All alerts are classified as HIGH severity (level 10) with identical signature: "POSSBL SCAN SHELL M-SPLOIT TCP", indicating potential exploitation attempts against web shells or command execution endpoints. The attack vector is inbound, with scanning activity directed at internal IP addresses (66.96.202.66, 66.96.202.70) and one external-facing host (129.126.144.227). No outbound or lateral movement indicators are present. Immediate network-level blocking is required. No known compromise confirmed at this time, but the behavior is consistent with automated exploitation frameworks targeting misconfigured web applications or legacy systems.

Key Findings:

- Three unique external IPs are conducting repeated scans for shell exploitation vectors on internal infrastructure
- All attacks use identical Suricata signature: "POSSBL SCAN SHELL M-SPLOIT TCP", indicating potential use of known exploit patterns (e.g., PHP shell, reverse shell probes)

- Targets include internal hosts (66.96.202.66, 66.96.202.70) and one external-facing system (129.126.144.227)
- No evidence of successful exploitation, C2 activity, or data exfiltration detected
- Attack timing shows rapid, consecutive attempts (within 40 minutes), suggesting automated scanning
- No custom threat intelligence available for correlation; pattern matches known shell probe behavior

Top 5 Priority Threats:

IP Address	Country	Activity	Severity	Count
103.227.91.90	India	Shell exploit scan attempt	HIGH	1
68.183.62.229	United States	Shell exploit scan attempt	HIGH	1
64.62.156.61	United States	Shell exploit scan attempt	HIGH	1

Additional 777 threats identified. Infrastructure alerts filtered: 0.

MITRE ATT&CK Mapping:

Tactic	Technique ID	Technique Name	Observed Behavior
Reconnaissance	T1595.001	Active Scanning: IP Blocks	Scanning of 66.96.0.0/16 for shell exploits
Initial Access	T1190	Exploit Public-Facing Application	Attempted exploitation via TCP shell probe patterns

Confidence: High - Signature matches known patterns in exploit frameworks targeting web shells and command execution vulnerabilities.

Immediate Actions:

1. **Network-level blocking:** Add firewall rules to block source IPs: 103.227.91.90, 68.183.62.229, 64.62.156.61

2. **Service hardening:** Review and harden web application endpoints (especially PHP, CGI, or legacy web services) on 66.96.202.66 and 66.96.202.70
3. **Monitoring enhancement:** Deploy detection rules for "shell.php", "cmd.php", "index.php?cmd=", and similar patterns in HTTP traffic
4. **Investigation:** Forensically examine 66.96.202.66 and 66.96.202.70 for unauthorized file uploads or unexpected processes
5. **Threat hunting:** Proactively search for web shell artifacts (e.g., base64-encoded payloads, suspicious file creation times) across all web-facing systems

Priority: CRITICAL - Execute within 1 hour.

Technical Summary:

Attack vector: External reconnaissance with exploitation intent targeting web application shells via TCP Target services: Web servers (port 80/443), legacy application endpoints Exploitation techniques: Shell probe scanning, potential command execution attempts Threat actor infrastructure: Hosting providers in India and US (no public abuse records at time of analysis) C2 indicators: None detected Exfiltration indicators: None detected

Analysis Complete

Report generated: 2025-11-27T07:35:00Z Threat level: HIGH Priority actions: 5 identified Threats requiring immediate blocking: 3 Suspected compromises: None detected
